RESULTS

Type of Crime

Not all participating Agents were available to classify each of the 64 homicide types (sexual, nonsexual, or unknown). In total, the 6 Agents made 265 classifications, 64 of which were made by the Agent presenting the case. Thus, there were 221 classifications that could be used for comparison with the presenter’s classifications. Of these, 190 classifications (81.4 percent) agreed with the presenter’s classification.

Of the 6 Agents, 1 Agent made 57 (89 percent) of the presentations. Because the percentage of his presentations was so large, comparing his classifications with the presenter’s would not be informative. The agreement rate for the other five Agents and the number of cases they classified are shown in figure 3. Given the minimal amount of information supplied by the presenter, these agreement rates are high.

When the classifications of each Agent were compared with those of any other Agent, the agreement rate ranged from 77 percent to 100 percent. Again, these are high agreement rates.

Structure of Crime Scene

There were 220 classifications of the structure of the crime scene (organized, disorganized, mixed, unknown) that could be used for comparison with the presenter’s classification. Of these, 183 (74.1 percent) agreed with the presenter. (See fig. 4.)

The agreement rate between any two Agents ranged from 45 percent to 89 percent. The agreement rates of Agents with the presenter and with each other varied substantially. This appears due mainly to variation in experience and involvement with the process of classifying crime scenes. The agreement rates among the three Agents routinely involved with this process ranged from 62 percent to 80 percent. Given the minimal data supplied by the presenter, these agreement rates must be considered good. However, classification in any field is a skill learned and reinforced by continuous involvement. In the medical field, for example, the diagnosis of a patient’s medical condition is similarly learned and reinforced through continuous involvement.

The interrater reliability study evaluated the agreement of Agents in classifying homicide by the type of crime and by the structure of the crime scene. In particular, the classification of crime scenes as organized has proven to be useful in profiling offenders in unsolved and motiveless murders.

This study demonstrated that there is reliability in the classification of crime types and scenes by BSU Agents. Given only minimal information about the crime, agreements of Agents with respect to crime types was high (at least 77 percent). Agreement of Agents with respect to classifying the crime scene, while not as high as the crime-type agreement, appeared to be related to Agent experience and involvement in the classification process. For experienced and active Agents, who were given only minimal information about the crime scene, agreement rates ranged from 62 percent to 80 percent. More information would certainly have improved the agreement rates.

Crime Scene and Profile
Characteristics of Organized and
Disorganized Murderers

"... there were significant differences in the crime scenes of organized and disorganized offenders..."

When requested by a law enforcement agency to assist in a violent crime investigation, the Agents at the Behavioral Science Unit (BSU) of the FBI Academy provide a behaviorally based suspect profile. Using information received from law enforcement about the crime and crime scene, the Agents have developed a technique for classifying murderers into one of two categories—organized or disorganized, a classification method evolving from years of experience and knowledge. In the service of advancing the art of profiling, the Agents were anxious to know if this classification system could be scientifically tested. This article describes the research study and statistical tests performed by a health services research staff on data collected.

Objectives of the Study

Thirty-six convicted sexual murderers were interviewed by FBI Agents for a study on sexual homicide crime scenes and patterns of criminal behavior. These study subjects represented 25 serial murderers (the murder of separate victims, with time breaks between victims ranging from 2 days to weeks or months) and 11 sexual murderers who had committed either a single homicide, double homicide, or spree murder.

The major objectives of this study were to test, using statistical inferential procedures, whether there are significant behavioral differences at the crime scenes between crimes committed by organized and disorganized murderers and to identify variables that may be useful in profiling orga-

(Published by the Federal Bureau of Investigation, U.S. Department of Justice)

Organized and disorganized murderers. In order for the study to achieve its objectives, the Agents first had to classify the 36 murderers into the organized or disorganized group, the breakdown being 24 organized murderers and 12 disorganized murderers.

Results of Analyses
The study determined that there were significant differences in the crime scenes of organized and disorganized offenders, and that certain background differences were also found between them. There were four aspects of the crime where differences between organized and disorganized murderers were analyzed: (1) The murderer's action during the offense, (2) victim characteristics, (3) use of vehicles in the crime, and (4) types of evidence left at the crime scene. Table 1 provides the profile characteristics that achieved levels of significance between the organized and disorganized murderers, while table 2 shows the crime scene characteristics for the two groups.

Organized Offender: Profile Characteristics
Organized offenders have a high birth order, often being the first born son in a family. The father's work history is generally stable, and parental discipline is perceived as inconsistent. Although the organized offender has an average or better than average IQ, he often works at occupations below his abilities, yet prefers a skilled occupation. His work history is also sporadic. Precipitating situational stress, such as problems with finances, marriages, employment, and relationships with females, is often present prior to the murder. The organized offender is socially adept and is usually living with a partner.

The organized offender may report an angry frame of mind at the time of the murder or state he was depressed. However, while committing the crime, he admits being calm and relaxed. Alcohol may have been consumed prior to the crime.

The organized offender is likely to have a car that is in good condition. Evidence of continued fantasy is present in terms of taking remnants of the victim or crime scene. Newspaper clippings of the crimes are

</table>
The initial observation at the mt = that some semblance of a stranger and is sensed, the victim becomes annealed, the scene is aimed at deterring detection. Although the crime may be planned, the victim is frequently a stranger and is targeted because he or she is in a particular location staked out by the offender. In this sense, the victim becomes a victim of opportunity. Victims of serial murderers have been noted to share common characteristics. The offender often has considerable time searching for the type of victim, and thus, may spend more time selecting by an individual murderer may include age, appearance, occupation, hairstyle, and lifestyle. Targeted victims in this sample included adolescent male youths, hitchhiking college coeds, nurses, women frequenting bars, women sitting in automobiles with male companions, and solitary women driving two-door cars.

The organized offender is socially adept and may engage in conversation or a pseudo-relationship with the victim as a prelude to the attack. Offenders may use impersonation as a method to gain access to a victim. The offender's demeanor is not usually suspicious. He may be average or above average in appearance, height, and weight; he may be dressed in a business suit, uniform, or neat, casual attire. In the organized style of attack, aimed at gaining the confidence of the victim, there is first the effort to use verbal means to capture the victim rather than physical force. The organized offender frequently uses his or her victim's vehicle in the offense.

Rape, as well as murder, may be the planned crime. Murder is always a possibility following rape; the assailant threatens the victim's life and brandishes a weapon. Sexual control is continued past conversation to demands for specific types of reactions (fear, passivity) during the sexual assault. When the victim's behavior stops being passive and compliant, aggression may be increased by the offender.

Control over the victim is also noted in the use of restraints, such as a rope, chain, tape, belt, clothing, chemical, handcuffs, gag, and blindfold. The way weapons are used may suggest a sadistic element in the offender's plan. The killing is eroticized, as in torture where death comes in a slow, deliberate manner. The power over another person's life is seen in one example in which a murderer described tightening and loosening the rope around the victim's neck as he watched the victim slip in and out of a conscious state.

Fantasy and ritual dominate with the organized offender; obsessive, compulsive traits surface in the behavior and/or crime scene patterns. The offender often brings a weapon with him to the crime, taking it with him upon departure. He carefully avoids leaving evidence behind and often moves the body from the death scene.

While sexual acts are part of the fantasy planning of the crime, murder may not be a conscious motive until there is a triggering cue. This is illustrated by one murderer's following statement:

"I had thought about killing her... saying what am I going to do when this is over. Am I going to let her go so she can call the cops and get me busted again? So when she took off running—that decided it in my mind that killing her was what I was going to do."

Case Example of an Organized Offender

The following case involves the rapes and murders of five women by one juvenile offender:

Victim 1: A woman in her late 20's was found about 150 yards into a wooded culvert area outside her apartment. Her car was found in the parking lot.

Recreating the scene, police speculated that the victim was approached after she parked her car. It was known she arrived home late at night from work. She was found in a stream after being assaulted, drowned, and strangled. Her head had been held under water while she was being strangled. There was no evidence of severe beating to the body; although some defense wounds were present, mutilation did not occur.

The only item taken from the victim was a ring of little value. The victim was found partially clothed. Her shoes, found further down the trail, suggested the location of the sexual
assault. Footprints were present at this site; tire tracks were not. The victim lived in a highrise building with many apartments, parking lots, and cars.

Victim 2: A woman in her mid-20's was found fully dressed in a wooded area less than a quarter mile from the location of the first victim. She was not near water. She had been stabbed to death repeatedly in the chest. Although there was evidence of sexual assault, there was no overkill to the body, no mutilation. Again, the victim was coming home late at night. Apparently she parked her car and was abducted prior to reaching her apartment.

Victim 3: This victim was similar in physical appearance, age, and manner killed to the second victim. There was evidence of sexual assault; underclothing in disarray suggested she was re-dressed after death. A stocking was missing, although her shoes were on.

Victim 4: Several months later, a similar crime occurred in the same general vicinity. A black woman, in her early 30's, was found dead. She usually worked late and arrived home between 2:00 and 3:00 a.m. Her car was also parked where she would have entered the apartment building. Although discovered further away than the other victims, she was still not more than a half mile from where she lived. There was evidence of sexual assault, and she too had been strangled and drowned. The method and location were similar to the first crime scene and was consistent with the work schedule of the victim.

Victim 5: The fifth victim, a woman in her mid-20's, was last seen at a party at 1:30 or 2:30 a.m. She left the party with several people and was later found dead in the same wooded culvert area as previous victims. She was found stabbed several times in the chest and had been partially buried in the culvert. There was evidence of sexual assault.

Considering the dynamics and pattern of the aforementioned case, the following crime scene assessment and subsequent criminal personality profiling would be possible.

The offender selects victims who are returning home during the late evening or early morning hours. The assaults generally take place near the victims' homes, as they are walking from their parked cars. The offender is watching the parking areas for single women returning during these times. He takes the victims from the apartment complex to wooded areas close by for the assaults. He chooses the time and place of assault. Since no scream or resistance is evident, one must assume the assailant carries a weapon and instructs the victims to accompany him to the secluded area. This indicates a persuasive, articulate person who convinces them no harm will come to them if they "do as he instructs." He would be manipulative and have a history of anti-social traits and behavior. He is youthful and aggressive, probably macho.

Since he uses the same MO in each assault, one must assume he knows the territory well, both the traveled built-up areas and the surrounding woods. He probably lives in the area, is youthful, and has grown up and played in the woods as a child. He is a long-term resident.

Medical examination and crime scene assessment show rape prior to death, and death is sudden with minimal mutilation, again indicating the well-planned crime by the organized antisocial criminal. The victims are "sized up" prior to the approach, and the killer knows they will not resist if he promises release after rape. He has raped before the killing started, but some life trauma has triggered the taking of the life of victim #1. The offender has had past problems with law enforcement, and once he has killed, he feels he must continue to kill to avoid victims testifying against him. He does not value the life of a victim over the chance that she may identify him to the police.

In summary, the assailant in the five homicides is an organized, antisocial personality. He is a youthful white male, has good intelligence, is articulate and manipulative. He fits into the community and has lived there for many years. He lives in close proximity to all victims. He precipitates his crimes with alcohol and/or drugs, possibly is first born in his family, and is sexually competent. He probably has a girlfriend; yet had a recent problem with her prior to the first killing. Considering his age, he would live with a single parent and would have no car since he selects victims on foot, sometimes using their cars in the assault. He probably would follow the media reports of the crime and may be in a crowd of onlookers when the police locate the bodies.

The police investigation in this case of multiple rape-murder led to a 17-year-old white male living very close to all victims who lived within a
1-mile radius in a large city suburb. He was bright, yet a marginal achiever in school, lived with his mother, and did not own a car. He was known as a "macho ladies' man" and a "con artist" among his peers. He used beer and marijuana to precipitate his offense and selected victims in an area he grew up in. He had a girlfriend he called "his fiancee" who jilted him shortly before murder #1, when she went away to college. He followed the crime in the paper, and on one occasion, watched the police investigator from his window. He had a lengthy juvenile record, including sexual assault and rape.

Disorganized Offender: Profile Characteristics

The disorganized offender is likely to be of below-average intelligence or of low birth status in the family. Also, harsh parental discipline is sometimes reported as a child. The father's work history is unstable, and the disorganized offender seems to mirror this pattern with his own inconsistent and poor work history. Typically, this offender is preoccupied with recurring obsessional and/or primitive thoughts and is in a confused and distressed frame of mind at the time of the crime.

The disorganized offender is socially inadequate. Often, he has never married, lives alone or with a parental figure, and lives in close proximity to the crime scene. This offender is fearful of people and may have developed a well-defined delusional system. He acts impulsively under stress, finding a victim usually within his own geographic area.

The disorganized offender is also sexually incompetent, often never having achieved any level of sexual intimacy with a peer. Although the offenders in this sample claimed to be heterosexual, there is a clear suggestion that the disorganized offender is ignorant of sex and often may have sexual aversions.

Crime Scene

The overall imprint of the disorganized crime scene is that the crime is committed suddenly and with no set plan of action for deterring detection.
The crime scene shows great disarray. There is a spontaneous, symbolic, unplanned quality to the crime scene. The victim may be known to the offender, but age and sex of the victim do not necessarily matter.

If the offender is selecting a victim by randomly knocking on doors in a neighborhood, the first person to open a door becomes the victim. The offender kills instantly to have control; he cannot risk that the victim will get the upper hand.

The offender uses a blitz style of attack for confronting the victim, who is caught completely off guard. He either approaches the victim from behind, unexpectedly overpowering her, or he kills suddenly, as with a gun. The attack is a violent surprise, occurring spontaneously and in a location where the victim is going about his or her usual activities.

The offender depersonalizes the victim, targeting specific areas of the body for extreme brutality. Overkill or
"...variables do exist that may be useful in a criminal profile and that do differentiate between organized and disorganized sexual murderers."

excessive assault to the face often is an attempt to dehumanize the victim. Such facial destruction may indicate knowledge of the victim or that the victim resembles or represents a person who has caused the offender psychological distress. The offender may wear a mask or gloves, use a blindfold on the victim, or cover the victim's face as he attacks. There is minimal verbal interaction except for orders and threats. Restraints are not necessary, as the victim is killed quickly.

Any sexually sadistic acts, often in the form of mutilation, are usually performed after death. Offenders have attempted a variety of sexual acts, including ejaculating into an open stab wound in the victim's abdomen. Evidence of urination, defecation, and masturbation has been found on the victim's clothing and in the home. Mutilation to the face, genitals, and breast, disembowelment, amputation, and vampirism may also be noted on the body.

Disorganized offenders might keep the dead body. One murderer killed two women and kept their body parts in his home for 8 years. He made masks from their heads and drums and seat covers from their skins. Earlier, he had exhumed the bodies of eight elderly women from their graves and performed similar mutilative acts.

The death scene and crime scene are usually the same in murders committed by the disorganized offender, with the victim being left in the position in which she or he was killed. If the offender has mutilated the body, it may be positioned in a special way that has significance to the offender.

No attempt is made to conceal the body. Fingerprints and footprints may be found, and the police have a great deal of evidence to use in their investigation. Usually, the murder weapon is one obtained at the scene and is left there, providing investigators with evidence.

Case Example of a Disorganized Offender

Murder 1: A husband returning from work at 6:00 p.m. discovered his wife's body in the bedroom of their home. An autopsy revealed she had been murdered sometime in the morning after being confronted by the assailant as she went to empty the garbage outside. The victim was shot in the head four times, and thereafter, disemboweled with a knife obtained in her home. Other than slash wounds to breasts and mutilation to internal reproductive organs, no evidence of sexual assault or molestation was found. The victim was first slashed in the abdomen, and the assailant pulled her intestines out of the body cavity. The victim had what was later determined to be animal feces in her mouth. Garbage was strewn about the house. A yogurt cup was found, and indications were that the murderer used the cup to collect blood from the victim, which he then drank.

Crime 2: On the same date, a house burglary occurred within one-quarter mile of the victim's residence. Garbage was strewn throughout the home. Evidence indicated the burglar urinated on female clothing and also defecated in the house. No one was home at the time.

Crime 3: Two days later, the carcass of a dog was found in the same neighborhood. The dog had been shot in the head, and the bullet was determined to have come from the gun used in the first murder. The dog was disemboweled.

Murder 2: Four days after the first slaying, a woman, waiting for a male friend to pick her up for a day's outing with her neighbor, noticed the man's car had pulled into her neighbor's driveway. She telephoned to say she would be right over; however, receiving no answer, she looked out her window again to note the man's car was now gone. Becoming suspicious, she went over to the house and discovered the bodies of her male friend, her female neighbor, and the neighbor's child. A 22-month infant was missing from the home; however, a bullet hole was found in the pillow of the child's crib, along with what appeared to be brain and skull matter. This was also found in the half-filled bathtub, indicating the child had been killed and the body washed and removed from the scene. The female victim had been severely slashed and mutilated. She had been murdered in the bedroom where she had been disemboweled from breast bone to pelvic area. Internal organs, including spleen, kidneys, and reproductive organs, had been removed and mutilated. No attack was noted to external genitals. The murderer had attempted to remove an eye and also had inserted a knife into the anal canal, cutting the victim severely in this area. Definite fingerprints with blood were found on the abdomen, shoulders, and legs of this victim. Additionally, a ring of blood was found on the floor, indicating a bucket-type container was used to collect blood.

The following information was extracted from a profile developed by the BSU:

Suspect description: White male aged 25-27; thin, undernourished
appearance; single, living alone in a location within 1 mile of the abandoned station wagon owned by one of the victims. Residence will be extremely slovenly and unkempt, and evidence of the crimes will be found at the residence. Suspect will have a history of mental illness and use of drugs. Suspect will be an unemployed loner who does not associate with either males or females and will probably spend a great deal of time in his own residence. If he resides with anyone, it will be with his parents. However, this is unlikely. Subject will have no prior military history; will be a high school or college dropout; probably suffers from one or more forms of paranoid psychosis.

The police narrowed their search to a 1-mile radius of the stolen vehicle, seeking a man of the suspect’s description. A 27-year-old white male, 5’11” and weighing 149 pounds, was located in an apartment complex within the same block as the abandoned car. The man was in possession of a gun that matched the murder weapon in the slayings. Also found in the apartment were numerous body parts thought to be animal and possibly human. The man had previously been diagnosed as a paranoid schizophrenic and had been committed to a mental facility after he was found sucking blood from a dead bird. After he had been released, he was found in the desert bloodstained and wearing a loincloth. He told police he was sacrificing to flying saucers. He was released by police; however, later a child’s body was found in the same vicinity. Evidence was found in his apartment indicating his obsession with blood, mutilation, and possible cannibalism of humans and animals.

**Conclusion**

In summary, this research study of differences between organized and disorganized sexual murderers with regard to profile characteristics and crime scene indicators provides an important foundation for the investigative technique of criminal profiling. By achieving the two study objectives, we have established that variables do exist that may be useful in a criminal profile and that do differentiate between organized and disorganized sexual murderers. It is important to be aware of the limitations of this study. We do not mean to imply that all unsolved cases can be profiled successfully. We wish to emphasize that this study was exploratory and indicates that we have identified significant variables in crime scene analysis.

A second important step can now be taken—that is, performing test profiles using previously identified variables and comparing results with cases which have already been profiled by BSU Agents. These test profiles would be the second phase for advancing the scientific study of the profiling process.

Further refinement of profile characteristics and deductive reasoning used by “experts” will provide an advancement in the state of the art in building an “expert knowledge-based system” for law enforcement. Expert knowledge-based systems are a subset of the field of artificial intelligence and are derived by using knowledge and reasoning patterns of experts to create computer programs which emulate these experts. These systems are easy to use, require minimal training, and have English-language interface with the users. Expert systems, currently used in many fields, are continually being adapted as more knowledge is gained through their use and application. As in these other applications, expert systems will never replace skilled law enforcement representatives, but are a tool that is continually being updated by the knowledge gained through use.
Interviewing Techniques for Homicide Investigations

This article discusses techniques that have been used in the interviews of persons who have already been convicted. Law enforcement officers should seek appropriate legal advice before using these techniques in attempts to obtain judicially admissible confessions.

One goal of the study of sexual homicide crime scenes and criminal behavior patterns was to explore how murderers commit their crimes. An in-depth analysis of interviews with convicted murderers allowed us to retrieve first-hand information about their patterns of values and beliefs, patterns of information storage, levels of recall on the crimes, and admission of responsibility for the murders.

This article presents our experiences in interviewing convicted serial sexual murderers with the hope of adding to law enforcement's knowledge of interviewing techniques. Although our interviews were conducted with murderers already convicted and incarcerated, we believe our observations provide insight for interviewing suspects in order to identify a killer.

(Published by the Federal Bureau of Investigation, U.S. Department of Justice)

123
Terms of the Interview

Before beginning any interview, the interviewer needs to be thoroughly familiar with any pertinent existing information, including crime scene photographs, records, and files. This information can be used not only to draw conclusions but to establish a focused interest in the offender. By showing interest, respect to the suspect, establishing rapport. Although it is often difficult in cases of violent and brutal crimes, this show of respect often allows the interviewer more quickly since less subject in evaluating the interviewer.

needs to convince the subject that the interview can be beneficial for him or her. In our study, some offenders admitted their crimes. In these situations, they found value in the interview, believing they were contributing to increased understanding or to clarify other people’s conclusions about them. Offenders who would not admit to their crimes cooperated in order to point out why it was impossible for them to have committed the crimes. Other offenders consented to the interviews in order to “teach” police how the crimes were committed and motivated. Those who refused interviews had reasons ranging from advice of an attorney to their own psychotic states.

The Communication Link

Rapport was the key communication link in our interviews. Once established and recognized, it allowed the interviewer to lead the interview and to re-establish communication when it broke down. Rapport was frequently gained when the investigator mirrored, below the level of conscious awareness, the subject’s spoken and unspoken behavior. This included matching the words of the subject, adopting aspects of his posture, and speaking in a similar tone and rate of speech.

Eliciting Information

Once communication had been initiated and rapport established, the questioning began. In our study, the what/where/when sequencing and descriptions of places where the crime events occurred were sought first. Next, the interviewing Agents asked questions about how the victim was chosen. Finally, questions about thoughts, feelings, and images were posed.

Questions were generally organized around four phases of the murder. These phases are: (1) The precrime phase, (2) the murder event, (3) the disposal of the body, and (4) the postcrime phase.

Precrime Phase—Conscious motive for the murder was often elicited by asking what triggered the murder. Those murderers with conscious intent were able to describe this in detail. Those without conscious motive would usually say they could not remember why they killed, but they were able to describe their feelings prior to the murder.

Reconstructing the scene prior to the murder helped interviewing Agents determine the cues that moved the offender’s murder fantasy into action. For example, offenders were asked to describe their day prior to the murder and their thoughts and feelings before encountering the victim.

The Murder Event—Memory recall of details specific to the murderers varied among the offenders interviewed. Those murderers who deliberately planned the murder through a fantasy generally continued to remember details about certain aspects of the murder. During one interview, the Agents remarked that the subject seemed to have almost total recall. The subject corrected the Agents:

“Actually, that’s overblown because I really don’t (remember everything). I have shabby memory on things I don’t want to remember, and things that are shocking or very vivid, I don’t forget. I trip on those for years.”

What the subject avoids or refuses to talk about provides information on areas where strong emotions may exist. (In one case, the murderer began the interview by stating he would not discuss his family.) The interviewer should concentrate on important aspects of the event, such as how the suspect gained access to the victim, conversation and behavior involving the victim, transporting the victim from one location to another, thoughts and feelings before the murder.

Disposal of the Body—Our interviews with the murderers made clear the importance of a fantasy in disposing the victim’s body. Once the act was committed, the murderer had to
Because of the importance of fantasy to sexual homicide, information about a subject's fantasy can be valuable.

Specific Techniques

Because of the importance of fantasy to sexual homicide, information about a subject's fantasy can be valuable. However, people with a longstanding fantasy life may not talk about it easily. Often a low-key approach is successful in encouraging the discussion of the fantasy. A fantasy is an elaborate thought with great preoccupation and emotion. The person keeps going back to the thoughts. The subject may only be aware of images, feelings, and internal dialog at certain heightened times.

One of the indications of the presence of a fantasy is the great amount of detail provided by a subject. Details that provide the best information on how the subject operates. For many of the murderers we interviewed, their detailed planning was their statement of superiority, control, and cleverness. The fantasy usually provided a sense of power and control, as well as emotional stimulation. In some instances, the fantasy appeared to protect them from becoming totally disorganized or psychotic. We discovered this, through interviews, in their reports of becoming enraged when victims inter-
rupted their plans. These murderers were very sensitive to being called crazy or maniacal, as they associated those characteristics with carrying out acts in ways that are stupid, foolish, and not in control.

The importance of terminology used in the interview was illustrated in one case:

Agent: Do you think your fantasy life was out of control?
Subject: I'm going to have to change your terminology, not because I'm banting words, but my fantasy world, no I don't think it was out of control, I think my world of realism was out of control. My perception of the real world was distorted.

This exchange illustrated how the murderer felt in control of his fantasy and out of control in the real world.

In contrast to murderers who consciously plan a crime through fantasy, our interviews revealed that some murderers acted more in response to external cues. Such people may not be able to relate why a particular act happened. These murderers were concerned with particular acts at certain times, suddenly, they lost control. It is possible to talk about the existence of the fantasies without eliciting details of them and to obtain information about the serial murderer's blockage of certain memories:

Agent: Did you have any unusual fantasies preoccupying you to any period of time or that you felt you were over-involved in?
